

My first LaTeX document

Hubert Farnsworth*

August 2022

Abstract

This is a simple paragraph at the beginning of the document. A brief introduction about the main subject.

1 StaUp

After our abstract we can begin the first paragraph, then press “enter” twice to start the second one.

This line will start a second paragraph.

I will start the third paragraph and then add
a manual line break which
causes this text to start on a new line but remains part of the same paragraph.
Alternatively, I can use the `\newline`
command to start a new line, which is also part of the same paragraph.

2 preamble

We have now added a title, author and date to our first \LaTeX document!
The universe is immense and it seems to be homogeneous, on a large scale,
everywhere we look.

*Funded by the Overleaf team.

3 How to include pic?

There's a picture of a galaxy above.

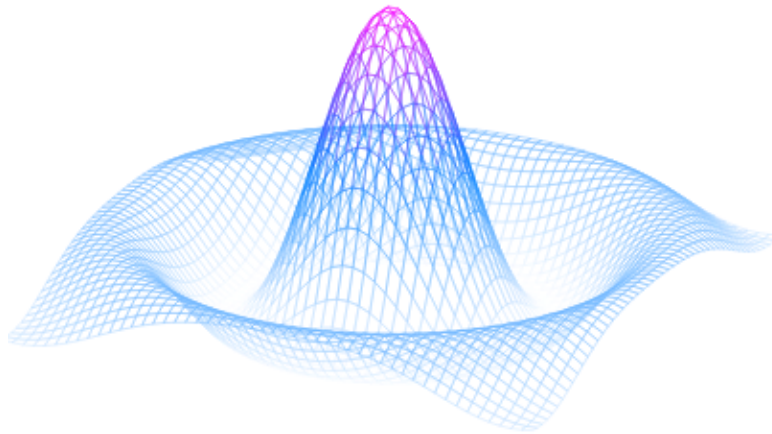

Figure 1: a nice plot.

As you can see in figure 1, the function grows near the origin. This example is on page 2.

- This is
 -
 - a
 - unordered list?
1. This is
 2. a
 3. ordered list?
 - 4.

4 type Math formula

In physics, the mass-energy equivalence is stated by the equation $E = mc^2$, discovered in 1905 by Albert Einstein.

The mass-energy equivalence is described by the famous equation

$$E = mc^2$$

discovered in 1905 by Albert Einstein.

In natural units ($c = 1$), the formula expresses the identity()

$$E = mc^2 \tag{1}$$

or in this way

$$E = mc^2$$

Subscripts in math mode are written as a_b and superscripts are written as a^b . These can be combined and nested to write expressions such as

$$T_{j_1 j_2 \dots j_q}^{i_1 i_2 \dots i_p} = T(x^{i_1}, \dots, x^{i_p}, e_{j_1}, \dots, e_{j_q})$$

We write integrals using \int and fractions using $\frac{a}{b}$. Limits are placed on integrals using superscripts and subscripts:

$$\int_0^1 \frac{dx}{e^x} = \frac{e-1}{e}$$

Lower case Greek letters are written as ω δ etc. while upper case Greek letters are written as Ω Δ .

Mathematical operators are prefixed with a backslash as $\sin(\beta)$, $\cos(\alpha)$, $\log(x)$ etc.

5 First example - mutiple-line formula

The well-known Pythagorean theorem $x^2 + y^2 = z^2$ was proved to be invalid for other exponents, meaning the next equation has no integer solutions for $n > 2$:

$$x^n + y^n = z^n$$

Second example - mutiple-line formula

This is a simple math expression $\sqrt{x^2 + 1}$ inside text. And this is also the same: $\sqrt{x^2 + 1}$ but by using another command.

This is a simple math expression without numbering

$$\sqrt{x^2 + 1}$$

separated from text.

This is also the same:

$$\sqrt{x^2 + 1}$$

...and this:

$$\sqrt{x^2 + 1}$$

Second example - mutiple-line formula

cell1	cell2	cell3	cell1	cell2	cell3
cell4	cell5	cell6	cell4	cell5	cell6
cell7	cell8	cell9	cell7	cell8	cell9

Col1	Col2	Col2	Col3
1	6	87837	787
2	7	78	5415
3	545	778	7507
4	545	18744	7560
5	88	788	6344

Table 1 shows how to add a table caption and reference a table.

Col1	Col2	Col2	Col3
